

The **ENCRYPTOKEY** assumes all networks are unsecure and removes the burden from the network for security, which can be easily breached, and places the encryption in the key.

## Authentication at your Fingertips

The **ENCRYPTOKEY™** is a portable, secure and biometric USB platform that incorporates strong authentication and encrypted end-user digital identity management that is deployable at an enterprise level.

### The **ENCRYPTOKEY** has two unique applications:

The **ENCRYPTOKEY VPN Solution** offers a revolutionary new approach to secure networks with a crypto-analytically secure network operating system, allowing users to create communications as if they were on the same network. No other VPN meets the standards of security and features as the ENCRYPTOKEY; nor does any other device appreciate the importance of authentication.

The **ENCRYPTOKEY Video Solution** transforms the standard surveillance platform like no other product available. Breaking free from the need to monitor video in brick and mortar locations, the ENCRYPTOKEY Video Solution offers a mobile, remote security monitoring tool with secure user authentication.

#### **Product Specifications:**

- FIPS validated using bit AES Encryption
- Microsoft compliant PKI X.509 certificates
- Storage sizes from 512MB to 32GB
- Runs on Windows, Unix and Mac OS
- Zero software footprint – no software install required on host computer
